Strong evidence from EPUAP supports the fact that an individual has to be repositioned with greater frequency on a non-pressure redistributing mattress than on a viscoelastic foam mattress.

The **MediForm** can reduce the amount of pressure your patient is exposed to along with reducing the need for frequent repositioning of your patient due to its superior levels of temperature sensitive viscoelastic foam.

The **MediForm** provides a very high level of comfort as the foam conforms to body shape. This feature almost doubles the surface area contact reducing pressure especially in areas more susceptible to the risk of developing a pressure ulcer.

The **MediForm** cover is multi-stretch polyurethane, which positively helps to reduce shear and friction forces. The cover has welded seams and a full-length welded zip flap.

The cover also dissipates heat and moisture away from the patient.
